European Union

The European Union utilized Scytl's Election Night Report solution during its 2014 and 2019 parliamentary elections. The technology ensured that all European Union citizens had equal access to intuitive election results within minutes of receiving the results data.

Results from **28 countries**
and **210 million voters**
reported in **24 languages**

All results for
751 electoral seats
published in **10 minutes**

12 million visits to results
website, **300 visits/sec.**
on election night

How does *it work?*

Configuration

Our team of election experts will help you set up the platform with your election specifics or will train you to do it yourself. They will also ensure that all election reporting requirements are met, and that citizens have access to relevant information.

Upload

As election results data is received from polling stations, the files are easily uploaded to the platform. The data, which is always protected, is automatically processed, and the site and related visuals are adjusted with the new information.

Preview & Publish

Review how the election data will be displayed, verifying that it is to your liking, and then publish or update the data and graphics with the push of a button. Notifications of updated results will be automatically sent to key stakeholders.
